                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC having at least 2 portions, comprising treatment with nanoparticles that C carry oligonuclectides complementary to at least 2 parts of (1), where CC detectable change caused by hybridisation of the oligonuclectide to (1) of sobserved. The method is used to detect (or to separate) specific (1), CC e.g. for diagnosing a wide variety of diseases, sequencing, in forensic can large to the carrivatised nanoparticles are also useful for preparing consostructures useful, for example, as blochips, biofilters, mechanical conjugates, separation membranes, chemical sensors, in computers, and for CC drug delivery. Very stable nanoparticle-oligonuclectide conjugates can be produced, allowing their direct use (as probes) in polymerase chain creation, i.e. they survive multiple heating/cooling cycles so do not consider, without the need for special equipment, making possible rapid coligonucleotide-nanoparticle probes, and related sequences, used in the cc method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents a cyclic disulphide linked oligonuclectide which CCC may be coupled with colloidal gold particles (nanoparticles) and used to CC demonstrate the method of the invention. The invention relates to CC demonstrate the method of the invention. The invention relates to CC isolating or detecting a nucleic acid of interest, in a mixture of CC nucleic acids, by binding it to 2 or more complimentary nucleotides which CC colloidal gold) are used to both isolate and detect (e.g. by linking the particle to a fluorescent probe) the resultant complex. The methods are CC useful for detecting nucleic acids, natural or synthetic, and modified or CC unmodified. The methods may also be applied in the diagnost of genetic, bacterial and viral diseases, in forensics, in DNA sequencing, for CC paternity testing, for cell line authentication, and for monitoring gene CC therapy. The methods are further useful in research and analytical CC specific pathogens, for quick identification of an infection to assist in CC drug prescription, and in homes and health centres for inexpensive first-CC line screening. The methods, which are based on observing colour change CC with the naked eye, are cheap, fast, simple, robust (reagents are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

CC The invention relates to a method of detecting a nucleic acid (NA) having CC at least 2 portions comprising: (a) providing nanoparticles (NP) with CC attached oligonuclectides (CCN), where CON has a sequence complementary CC to the sequence of NA; (b) contacting NA and NP under conditions CC effective to allow hybridisation of CGN with NA; and (c) observing a CC detectable change brought about by hybridisation of CGN with NA. The CC method is useful for detecting a nucleic acid, separating a selected CC nucleic acid from others and methods of nanofabrication. Detecting CC analytes such as nucleic acids and proteins are useful for the diagnosis CC fgenetic, bacterial and viral diseases. The CGN NP conjugates that use CC cyclic disulphide linkers improve the sensitivity of diagnostic assays. In particular assays using CGN-NP conjugates prepared using linkers (comprising a steroid residue attached to a cyclic disulphide have been CC found to be approximately 10 times more sensitive than assays employing CC conjugates prepared using alkanethiols or acyclic disulphides as the CC linker. The CGN-NP conjugates are stable allowing them to be used CC directly in PCR solutions. Therefore conjugates added as probes to a DNA CT of the conjugates of the PCR and are still able to detect the amplicons without opening the tubes and causing contamination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of detecting (MI) a nucleic acid having two portions, involving providing nanoparticles having oligonucleotides attached to it, which has a sequence complementary to sequence of two portions of nucleic acid, contacting nucleic acid and nanoparticles, to allow hybridisation of oligonucleotides with two or more portions of nucleic acid, and observing a detectable change brought about by hybridisation. (MI), nanoparticles (I), nanoparticle-oligonucleotide conjugates (II) and the aggregate probe are useful for detecting two or more nucleic acids (from a biological source) having at least two portions, such as viral RNA, bacterial or fungal DNA, a gene associated with a disease, synthetic, or structurally-modified natural or synthetic RNA or DNA, or a product of a polymerase chain reaction amplification. (II) is useful for preparing a nucleic acid bound to an electrode surface. (I) and (II) are useful for fabrication, and for separating a selected nucleic acid having two portions from other nucleic acids. (I), (II) and the aggregate probe are useful for detecting an analyte (especially polymucleotide used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 2915
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  portions. The method involves providing nanoparticles having colligonuclectides attached to it which has a sequence complementary to sequence of two portions of nucleic acid, contacting nucleic acid and comparticles to allow hybridisation of oligonucleotides with two or more partions of nucleic acid and observing a detectable change brought about by hybridisation. The method and aggregate probes are useful for detecting two or more nucleic acids (from a biological source) having at least two portions such as viral RNA, bacterial or fungal DNA, a gene associated with a disease, synthetic or structurally modified natural or synthetic RNA or DNA, or a product of a polymerase chain reaction amplification. The invention is useful for preparing a nanoprobe conjugate for detecting an analyte and for detecting a selected nucleic acid having two portions from other nucleic separating a selected nucleic acid having two portions from other nucleic acids. The present sequence is an oligo used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                         The synthetic oligomer is capable of forming a triplex at physiological CC pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human leukocyte adhesion protein p150, 95 alpha subunit gene (HMMNT02) CC beginning at nucleotide 677 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in CC diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays CC may be carried out without subjecting the test specimen to harsh CC conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (nucleotides are coupled through a xylene residue to form the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448.

This sequence was used as a PCR primer in order to add a polyA tail to the 3'end of the highest specific activity selected oligonucleotide in order to form a first strand. The primer is comprised of a 5'known sequence and a 3' polynucleotide portion corresp. to the polynucleotide tail of the first strand. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oligonucleotide binding; nucleotide binding; DNA detection; binding DNA treatment; diagnosis; testing; assay; Candida; papillomavirus; cytomegalovirus; pstein-Barr ir ir rhinovirus; hepatitis virus; liver disease; human immunodeficiency virus; herpes simplex virus; human immunodeficiency virus; HIV; ALDS; influenza virus; genetic disease; genetic abnormalities.

The DNA to be detected is amplified using PCR and then these probes which are pref. labeled using 32-P gamma-ArP are used to detect the mutant sequences. The primers and probes given in AAQ92098-219 are used in the method of the invention for detecting mammalian target DNA in sputum samples. Analysis of the target DNA is used to diagnose benign or malignant neoplasms of the lung. It is also useful for screening people at high risk or for monitoring progress of treatment of lung neoplasms. The method is based on the discovery that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting target nucleic acid in mammalian sputum diagnosis of lung neoplasia involving mutation(s) or p53 tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mutant target DNA associated with lung cancer is present at detectable levels in sputum. Cells shed into sputum from head and neck cancers may also be detected

Proferably the antisense sequences are phosphorothicate oligonucleotides since these are not destroyed as fast by endogenous factors as naturally occurring molecules. (Updated on 25-MAR-2003 to correct PN field.)
                                        determining an oligonucleotide having specific activity for a target biomolecule. The method comprises assaying a set of randomised oligonucleotides for activity against a target biomolecule, separating active from inactive oligonucleotides and recovering, amplifying and determining the nucleic acid sequence of the active oligonucleotides. oligonucleotides can be used for therapeutic, diagnostic and research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determination; oligonucleotide; specific activity; therapy; target biomolecule; randomised oligonucleotide; diagnosis; chimeric; primer; ss.

                                                                                                                                                                                                                                      The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                                                                                                                                                                                                                                                                                                                                                                                             Ribozyme which modulates plant gene expression - preferably modulates expression of DELTA-9 desaturase or granule bound starch synthase in

                                                                                                                                                                                          CC disorder or related disorder. AXX88542 to AAX88705 represents human CC chromosome 18q VAC clones and primers corresponding to them, used in the CC exemplification of the present invention. YAC clones comprising a portion CC of the region of human chromosome 18q between markers D1858 and D185979 CC are used to identify at least one human gene associated with a mood CC disorder or related disorder. The mood disorder or related disorder, is CC chosen from the Diagnostic and Statistical Manual of Mental Disorders, is CC version 4 (DSM-IV) taxonomy. This includes mood disorders (296, XX, 300.4, CC version 4 (DSM-IV) taxonomy. This includes mood disorders (295, XX, 300.4, CC version 4 (DSM-IV) taxonomy. This includes mood disorders (295, XX, 300.4, CC version 4 (DSM-IV) axisity disorders (300.XX, 309.81, 308.3), CC version the disorders (309.XX) and personality disorders (codes 301.XX). CC version the disorders (309.XX) and personality disorders (codes 301.XX). CC version the used to detect pathological mutations or genetic code contact of the susceptibility of an individual to a mood disorder or can be used to treat mood disorder. The muchoic acids and proteins of the human gene can be contact to the susceptibility of an individual to a mood disorder or can be contact to the treat mood disorders and related disorders.
                                                                             Matches
                                                                                                Query Match

The antisense compound comprises a phosphorothicate antisense oligonucleotide which inhibits expression of human sentrin. (I) is useful for inhibiting expression of sentrin in human cells or tissues in vitro, for treating humans or other animals suspected of having or being prone to a disease associated with sentrin expression. (I) can also be used for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is an immunosuppressant inhibitor oligonuclectide, which is used in the invention. The invention relates to a composition which contains at least one inhibitor (less than 100 kD) of a substance (e.g. Cransforming growth factor TGF-beta, vascular endothelial growth factor TGF-beta, vascular endothelial growth factor TGF-beta, vascular endothelial growth factor VEGF, interleukin-10 II-10, prostaglandin E2 PGE2, or their receptors) that adversely affects the immune response. The composition also includes at least one stimulant that positively affects the immune response. This composition. The composition is used as an immunostimulant for the composition. The composition is used as an immunostimulant for the composition. The composition is used as an immunostimulant for the composition. The composition is used as an immunostimulant for the composition infections, particularly hyperproliferation; composition of neoplasms and infections, particularly hyperproliferation; colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus, colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus, colon-rectum, stomach, intestine, gall bladder or bladder), liver tumours, composition of which are directed against TGFbeta or VEGF, are inhibitors of monocyte chemotactic protein-1 (MCP-1) and are useful as anticularis, diabetes, glomerulonephritis, acute respiratory distress colifiammatories for treating e.g. asthma, Crohn's disease, ulcerative colific syndrome and the formation of atherosclerotic plaque
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TWFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TWFR1 human cel or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TWFR1 modulating the function of nucleic ac molecules encoding TWFR1, ultimately modulating the amount of TWFR1 produced. The antisense compounds and method are useful as research

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sato
                                                                                                                                                                                                                                                                                                              Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a DNA construct encoding a fusion protein comprising a Bacillus species cell wall protein fused to a cleavage peptide and a heterologous protein. The fusion construct is placed downstream of a Bacillus species promoter sequence. This sequence represents a PCR primer for the MPRBP-MPRBS part of the construct MPRBP-MPRBS-Met-ProInsulin, which comprises the Bacillus brevis middle wall protein mp5 linked to the human proinsulin protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                               AAZ6554 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical efficacious responses to and side effects from differential sefificacious responses to and side effects from the Dharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID Nos 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

                                                                                                                                               agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a semicone in the figure of pharmaceutical agents.
                                                                                                                                                                                                              invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    10-SEP-2001

                                                                                                                                                                                                                                                                                                 chemical or drug in a sample comprises contacting the sample with an oligonucleotide having specific activity for a target biomolecule and detecting the presence or absence of binding where the presence of binding indicates the presence of the chemical or drug in the sample. The oligonucleotide is identified by: (a) assaying a prepared set of randomized oligonucleotides for activity against a target biomolecule; (b) separating active from inactive oligonucleotides; and (d) characterizing the recovered oligonucleotides; and (d) characterizing the recovered can be used for diagnostic or research nurroses.

Rel/NF-C kappa-B proteins are involved in a diverse set of signaling pathways involving stress, apoptosis, cancer, growth, infection and inflammation. Antisense oligonucleotides are able to inhibit expression of the p65 subunit and may therefore be used in the treatment of disorders growth, infection. They may be used as a grophylaxis to prevent or delay infection, inflammation or tumour formation. Antisense compounds may also be used for research and diagnostics because they hybridise to nucleic acids encoding NF-kappa-B p65 subunit mRNA levels was measured using real-time quantitative PCR and Northern blot analysis. Antisense oligonucleotides were synthesised on an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC a DNA-binding domain shared by all members of this family. Through this cC motif, Ets family members bind to the promoter regions of various genes CC at a GCA consensus sequence, thereby acting as either repressors or activators of the gene. All but one Ets family protein bind to DNA as a CC monomer. Ets-2 has been implicated in the regulation of cellular CC proliferation and differentiation. The Ets-2 gene is located at CC chromosome 21q22.3, which is within a region known to undergo CC translocations associated with malignancies. Ets-2 has been found to be C upregulated in several cancers, including lymphoblastic leukaemia. It may CC also play a role in the cancer phenotype, as it activates the urokinase c plasminogen activator (uPA) promoter and the promoters of metalloproteinases in response to epidermal growth factor (EGF) C metalloproteinases in response to opidermal growth factor (EGF) C with tumour invasion and metastasis in breast cancers. As the Ets-2 gene is located on chromosome 21, which is triplicated in Down's syndrome, it is also thought to be responsible for the skeletal abnormalities present in this condition. The antisense oligonucleotides of the invention are useful for the treatment or prophylaxis of conditions associated with Ets
                                                                                                                                                                                                                                                                                                                                                                                                                   Best Loc

The antisense oligonucleotides were designed to target different regions of the human Ets-2 RNA, and were analysed for their effect on Ets-2 mRNA levels by quantitative real-time PCR. The Ets-domain transcription factors are a family of proteins which are involved in controlling key cellular events such as proliferation, differentiation and development. The Ets domain is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to the cloning and sequencing of the gene cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence a PCR primer which is used for the amplification of the DNA fragment representing the coding sequence for the C-terminal part of the encylreductase (ER) domain in module 5 of Streptomyces noursei PKS-
                                                                                                                                                                                                                                                             Synthetic oligonucleotide; dinucleotide repeat; cell cycle arrest; cell proliferation; caspase; tumour necrosis factor; TNF; cancer; carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 18 BP; 4 A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of a synthetic oligonucleotide useful to the CC invention. The invention relates to a composition, comprising a 2 to 20 base 3'-OH, 5'-OH synthetic oligonucleotide which comprises multiple CC base 3'-OH, 5'-OH synthetic oligonucleotide which comprises multiple CC formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of production of certivation of caspases and induction of apoptosis or production of cytokines such as interleukin (I)-1-beta, II-6, II-10, II-12 and tumour necrosis factor (TNF)-alpha by immune system cells, in an animal having CC cancer such as primary carcinoma, secondary carcinoma, primary sarcoma and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, CC colorectal, ovarian or bone cancer. The compositions induce apoptosis cindependent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug carcinome, caspase 3, transforming growth factor (TGF)-beta 1 receptor capable capable of transforming growth factor (TGF)-beta 1 receptor capable capable capable of transforming growth factor (TGF)-beta 1 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligonucleotides required for RNase H cleavage. Each oligonucleotide of the set had a different number of ribonucleotides, 2 in the present case. The oligonucleotides were mixed with target DNA oligonucleotide AGT02009 (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30 minutes. The results showed that 4 ribonucleotides were the minimum number for RNA cleavage. The invention provides probes for nucleic acid hybridisation. The probes form a hairpin structure comprising a double-stranded stem and a single-stranded loop, and are capable of both intramolecular and intermolecular hybridisation. The double-stranded stem may comprise a methylphosphonate DNA:RNA hybrid that is resistant to RNase H cleavage. When the probe hybridises with a target DNA, the RNA strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and can be removed. Arrays and methods for nucleic acid hybridisation using

       conditions from tissue samples. The method comprises obtaining a sample from test tissue or region to be diagnosed, performing a methylation assay of the sample, where the assay determines methylation state of genomic CpG sequences, and making a diagnostic or prognostic prediction of the cancer based at least in part upon the methylation state of the genomic CpG sequences. The method is useful for diagnosing cancer or cancer-related conditions such as gastrointestinal or esophageal adenocarcinoma, gastrointestinal or esophageal dysplasia, gastrointestinal or esophageal metaplasia, Barrett's intestinal tissue, pre-cancerous conditions in normal esophageal squamous mucosa, or their combinations, from tissue samples. Preferably, the cancer diagnosed is esophageal adenocarcinoma, and making a diagnostic or prognostic
                                                                                                                                                                                                                                                                                         Diagnosing cancer or cancer-related conditions, e.g., gastrointestinal and esophageal adenocarcinoma, comprises performing methylation assay a tissue sample obtained from a test tissue or region to be diagnosed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel gene cluster comprising the exbB, exbD and tonB genes from P. putida. These genes are useful for producing bacterial cells more sensitive to antibiotics, toluene, pHBA (parahydroxybenzoic acid), aromatic compounds, parabenes, and aromatic amino acids. Methods are also provided to identify pHBA tolerant genes, and pHBA tolerant strains, useful for producing pHBA. The present sequence represents a primer for RT-PCR amplification of P. putida exbB and exbD
                                                                                                                                                                                                                      The invention relates to a method of diagnosing cancer or cancer-related

             The present invention describes a method of arraying genome clones. The CC method comprises: (a) clones of the genomic libraries contained in CC multiwell plates numbered for discrimination are mixed in each of the CC multiwell plates; (b) a primer designed based on the chromosome marker gequence is added to the mixture to carry out an amplification reaction; (CC (c) a signal corresponding to the marker is detected from the resultant CC amplified product to specify the discrimination Nos. of the multiwell CC plates containing the clones having said marker sequence; (d) the order CC of the markers is changed so that the seme discrimination Nos. succeed to the markers is changed so that the seme discrimination Nos. succeed to CC the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified CC discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals are detected from the amplified producte solt; and (1) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed respects and arrayed the primers of the producte of the positions of the chromosome and arrayed. The chromosome are constituted as the positions on the chromosome and arrayed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The method provides an opportunity for early intervention, in patients identified with cancer, or an elevated risk for developing cancer. CpG-island methylation can easily be detected in a field of normal cell contamination as a gain of signal, unlike loss of gene expression (e.g., loss of heterozygosity (LOH) and deletion analysis), which is difficult to resolve in a sample with contaminating normal cells. AAS62902-AAS62966 represent oligonucleotide sequences used in diagnosis of esophageal adenocarcinoma as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 18

                                                                                                                                                                                                                       The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This property of the expression of the expression of TNFR1 antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antisense compound targeted to nucleic acid molecule encoding necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver continues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             represent PCR primers for human chromosome 21q22.1, we specifically claimed for use in the present invention
                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Baker BF,

                                                                                                                                                                                                                                                                        repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying a candidate polymorphic repeat within a coding sequence, understanding or treating genetic disease, comprises detecting tande repeats in a target coding sequence and scoring the repeats for polymorphic probability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EST; expressed sequence tag; ss; polymorphic repeat; tandem repeat; polymorphic marker prediction of ubiquitous simple sequences; POMPO Rep-X; human; genetic disease; drug-treatment; Machado-Joseph; Haw River syndrome; Huntington's disease; fragile-X syndrome;

                                                                                       Query Match
                                                                                                                                            lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients

                                                            용
                                                                                                                                                                                CC differentiating between hasmatopoietic cell proliferative disorders cassociated with at least 1 gene and/or their regulatory regions in a cc subject. The method comprises contacting a target nucleic acid in a cc biological sample obtained from the subject with at least 1 reagent, cc which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 cc represent specifically claimed nucleotide sequences from the present cc invention. Oligonucleotides from the present invention can be used: for cd differentiating between healthy hasmatopoietic cells and proliferative cc lasorder hasmatopoietic cells; for differentiating between acute myelogenous leukaemia; as probes for cd determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of hasmatopoietic cell proliferation disorder related sequences and their complements; and as primers for the cc related sequences and their complements; and as primers for the cc sequences. The nucleotide sequences from the gresent invention can also be used for detecting a predisposition to, differentiation between complements, treatment and/or monitoring of hasmatopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables a disorders allowing for improved and informed treatment of patients.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene. Preferred oligonucleotides are single-stranded, have at least one mismatch with respect to the HD gene region to be altered, and have chemical modifications, or are chimeric RNA/DNA oligonucleotides. They can be used for the treatment or prevention of HD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-AUG-2001; 2001US-0310757P.

                                                                                   ds; HLA-related research; HLA class II-associated disease; transplantation matching; recombination hot spot identification; linkage disequilibrium study; human; microsatellite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is an example of a poly-glutamine triplet repeat region found in exon 1 of the Huntington's disease (HD) gene. The invention is based on the discovery that oligonuclectides can be designed to target sequence alterations to the triplet repeat region of the HD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New single stranded oligonucleotides comprising a DNA domain least one mismatch with respect to the genetic sequence of th Huntington's disease gene to be altered, useful for treating preventing Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-AUG-2002; 2002WO-US025352

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an oligonucleotide primer capable of specifically hybridising to a DNA having the sequence of the flanking regions of a microsatellite selected from M2-4-9, M2-2-9, M2-2-12, M2-3-11, M2-2-20, M2-2-21, M2-2-22, M2-2-23, M2-2-24, M2-4-25, M2-4-26, M2-2-29, M2-2-32, M2-4-32, M2-4-33, M2-4-37, M2-3-32, M2-2-36, M2-5-11, M2-2-46, and M2-2-48. The primer is useful for determining the number of repeat units of the microsatellite cited above. The primer is useful in HLA-related research, such as genetic mapping of HLA class II-associated disease, transplantation matching, population genetics, and identification of recombination hot spots as well as linkage disequilibrium studies. The present sequence represents the human microsatellite repeat M2_3_8.
                      Adorjan I
Rujan T,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligonucleotide primer capable of specifically hybridizing to a DNA having the sequence of the flanking regions of a microsatellite (e.g. M249), useful for HLA-related research, e.g. transplantation matching.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one gene or its regulatory regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or a series of reagents, where the reagent or series of reagents, distinguishes between methylated and non methylated CpG dinucleotides within the target nucleic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful for detecting and differentiating between colon cell proliferative disorders, including cancers such as colon adenoma and colon carcinoma. The PNA (peptide nucleic acid)-oligomers are useful as probes for determining cytosine methylation state or single nucleotide polymorphisms. The current sequence is that of the hybridisation oligonucleotide of the invention which was used to analyse the genomic

Specifically, it refers to a method comprising contacting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated Cpd dinucleotides present in the target DNA. As such, it is possible to further adifferentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and PNA-oligomers that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPs) of the target sequence. This oligomucleotide sequence is a primer oligomer used for the analysis of CpG positions within genomic DNA, used in an exemplification of the

The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from upA (Urokinase plasminogen activator), SNCG (gamma-symuclein), IDE (insulindegrading enzyme), KNSL1 (Kinesin-like protein 1), LIPA (lysosomal acid lypase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the occurrence of neurodegenerative disease. The genes are all located on chromosome 10. M1 is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly Alsheimer's disease. The present sequence is a PCR primer, which was used in the method of the invariance.
                                                                                                                                                            Assay reagent contg. oligo-nucleotide probe attached via probe having hybridisation region complementary to specif sequence, e.g. for diagnosis of genetic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Probe fixed via 400nt poly-dT linker to a nylon Beta-thalassemia allele.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           31-OCT-2002

The oligomer binds to the transcribed region of the DNA so as to form a triple helix. The target region may like within an exon or an intron and the oligomer forms a triple helix by expliciting the CT motif (i.e. the oligomer is pyrimidine rich). The oligomer is useful in antisense therapy. It can also be used (opt. in labelled form) diagnostically to detect target DNA or RNA by hybridisation. See also AAQ25290-300.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EBV-transformed cell lines and mouse-human heterohybridomas producing human MAbs specific for the gp120 V3 loop of HIV-1 MN isolate were obtained. MAb 447-52D was found to recognise the tetrappetide motif GPGR, i.e. the Principal Neutralising Determinant common to the V3 loop of different HIV isolates. A recombinant Ab was derived from 447-52D comprising the H and L chain V regions, each fused to a signal sequence and to appropriate intronic sequences. The different fragments required to construct the fusion sequences were amplified by PCR. (Updated on 25-MAR-2003 to correct PN field.)

Detection is carried out by hybridisation of denatured (ss) sample DNA with a (ss) nucleic acid probe, complementary to the target sequence. Hybridisation occurs on the surface of an electrode or optical fibre and detection is visualised by the addition of an entity that recognises (ds) hybridised DNA and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection method of gene without using radio-isotope - by hybridisation of nucleic acid probe which is single strand having complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 1993-382240/48
                                The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                     04-DEC-1998;

                                                                                                                                                                                                                          designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin BI. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       map of the human genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel biallelic markers used to construct a high density disequilibrium
                                                                   Example 1; Page 17;
                                                                                                                                                                                                                                                                            10-APR-2000; 2000WO-NL000235.

The method involves hybridization of TF and OS, adding labeled nucleotide (N) or its analog (A) to (M), to extend OS, and detecting the hybrid and/or of OS with (N) or (A). The method is useful for detecting single nucleotide polymorphisms in constant amplification fragment length polymorphism-fragments. The method is useful for detecting single nucleotide polymorphisms (SNPs) located in constant amplification processed in the constant amplification in the constant amplification in the constant amplification is useful for detecting single nucleotide polymorphisms (SNPs) located in constant amplification is the constant amplification in the constant amplification is the constant amplification in the constant amplification is th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fragment length polymorphism (AFLP) fragments such that useful non-polymorphic bands, which ordinarily do not provide any useful information when conventional AFLP-finger printing is used, are made. SNPs are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  metabolīc disorder; Parkinson's disease; Tourette's syndrome; thrombosi type 2 diabetes; cardiovascular disorder; myocardial infarction; cancer cardiomyopathy; atherosclerosis; human immunodeficiency virus; HIV; viral infection; immunostimulant; neuroleptic; nootropic; tranquiliser; antidepressant; anorectic; PCR primer; gene therapy.

New isolated nucleic acid

encoding a new G-protein coupled receptor

The present invention describes an improved method of DNA synthesis provides double stranded DNA where the predetermined orientation of sequence is preserved. This can be used in the construction of complementary DNA and directional DNA libraries

which the

Double stranded DNA synthesis with specific orientation comprises synthesizing a first strand of DNA complementary to a selected DN template and synthesizing second strand complementary to first on

The protein and DNA sequences of the invention can be used to identify compounds which bind to GPCR polypeptides and in screening for compounds that modulate GPCR activity. By screening a human subject for the presence of mutations in GPCR DNA, a GPCR-related disorder or a genetic predisposition can be diagnosed. The sequences can also be used for treatment and prevention of mental disorders such as schizophrenia, attention deficit disorder, anxiety, depression, dementia and bipolar disorder, neurological disorders such as Huntington's disease and Tourette's syndrome, metabolic disorders such as obesity, anorexia and type 2 diabetes, cardiovascular disorders such as thrombosis, myocardial infarction, cardiomyopathy and atherosclerosis, viral infections caused by HIV and cancers
                                                                                                                                                                                                                            19-SEP-1988;

ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, antisickling, cytostatic, antiseborrheic, antidiabetic, antisickling, cytostatic, antiseborrheic, antidiabetic, antisickling, cytostatic, antiseborrheic, antidiabetic, antisickling, cytostatic, antiseborrheic, antidiabetic, antisickling, cophthalmological, cytostatic and cytocid in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Local

                                                                                                                     dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                exemplification of the present invention Sequence 19 BP; 3 A; 8 C; 1 G; 7 T; 0 U; 0 Other;
diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    matrix metalloproteinase; growth factor; reductase; scarring; cytostat antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar;
                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2001-300427/31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    26-OCT-1999;

AAH57577 to AAH62099 represent sequences used in the exemplification of the present invention
The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 9 A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               03-MAY-2001.

CC single strand conformation polymorphism (RT-PCR-SSCP) of PAX2 exon 8.

CC PAX2 is a transcription factor involved in the development of the nervous CC and excretory systems and mutations of PAX2 have been associated with CC optic nerve colobomas and renal hyperplasia. These mutations are CC modulating resistance to apoptosis. The method of the invention involves CC modulating resistance of normal tissues to apoptotic cell death induced by CC chemotherapy or radiation therapy. This is achieved by administering to a CC patient, a nucleic acid (I) encoding a molecule which selectively CC inhibits and/or prevents the function of the PAX2 gene. The method can be CC used to modulate resistance to apoptosis of cancer cells (prostate, cystic kidney cells in a patient in which PAX2 is expressed at higher CC cystic kidney cells in a patient, for rescuing cells from apoptosis or level than in a healthy patient, for rescuing cells from apoptosis in a

                                                                                              The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ALBSF79 to ALBSF31 represent
                                                                                                                                                                                                                                                                                                                     Collection of binding groups for determining or typing samples, especially clinical samples, has groups capable to identify ess all members of the family of nucleic acids of relatively high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic

                                                                                                                                                                                                                                    This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid
                                                                                                                                                                                                                                                                                                               Measurement

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises a method for screening for compounds that are capable of changing the binding properties of a G protein-coupled receptor protein. The method of the invention is useful for screening agonists or antagonists to alter binding properties of novel G protein-coupled receptor proteins in controlling cholesterol metabolism. The method of the invention is useful in the diagnosis and treatment of inflammatory diseases, excessive immune reaction after transplantation, immune insufficiency and infections. The present DNA sequence represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Screening method for agonists or antagonists to alter binding properties of novel G protein-coupled receptor protein in controlling cholesterol metabolism, used to diagnose and treat inflammatory diseases or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                12-APR-2001; 2001JP-00114203.
